

Kangaroo Island woodruff

Scientific name: ***Asperula tetraphylla***

National status (*EPBC Act 1999*): **Vulnerable**

South Australian status: (*NPW Act 1972*): **Vulnerable**

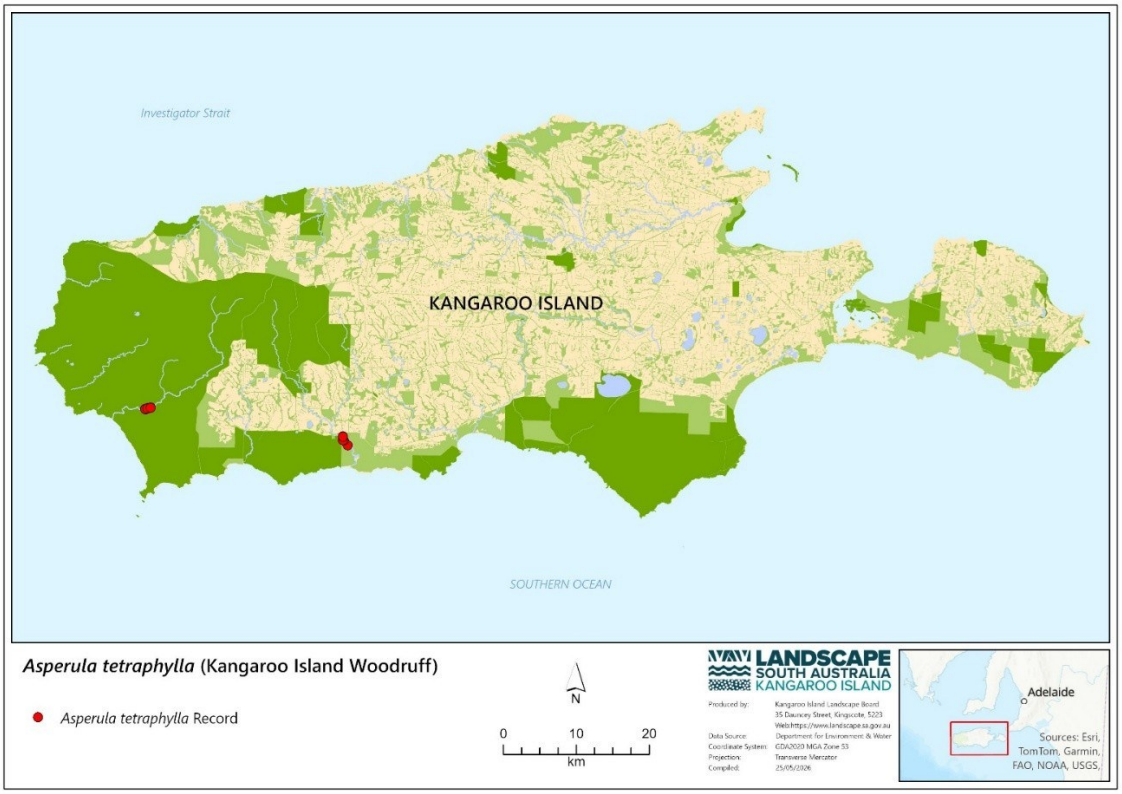

Description:

Prostrate decumbent perennial herb with slender stems. Broad leaves in whorls of four, to 6 mm long and 6 mm wide. Numerous white flowers in terminal clusters. Flowering between September and January.

Distribution:

Endemic to Kangaroo Island. A riparian species that grows on heavy silts and clay soils within oxbows or swales that form off main river channels.

Specific threats:

Threats to *Asperula tetraphylla* include weed invasion by exotic annual grasses and forbs, altered hydrological regimes resulting in reduced river flows, more frequent drought and flash flooding caused by climate change and a small and fragmented distribution.
